

King County Real Estate Consulting

Jake Sherman

Overview

- Using the King County data set, I create a linear regression to provide local homeowners advice on how best to renovate their home to optimize returns when they are ready to sell.
- Additional square foot adds \$96 to home value.
- Each unit of condition adds about \$41,000 to home value.

Business Value

- Linear Regression Model inform clients how units changes in certain independent variables will affect sales price.

| | date | price | bedrooms | bathrooms | sqft_living | sqft_lot | floors | waterfront | condition | grade | sqft_above | sqft_basement |

Baseline Root Mean Squared Error and Linearity

- Initial RMSE: \$241,000
- Average Price of home: \$540,300

Baseline Assumptions

Iteration 1: Drop Outliers

Iteration 2: Create Categorical Values

Improved R2 score but too many high p-values

Iteration 3: Feature Scaling

Results

- Improved linearity, normality, and homoscedasticity
- No high p-values (above .05)
- RMSE is now down \$144,361 from \$241,000

Conclusion

- Owner can add \$96 of home value for each additional square foot added of living space (finish attic, add onto house, etc).
- For every unit of increased condition as defined by Kingcounty.gov, a homeowner can expect to a gain of \$40,910. For a home with a condition level 1, doing a full renovation to a level 5 will add an estimated \$163,640.

Limitations

- Data did not have an ideal linearity which affected goodness of fit and predictability- different zip codes have a large effect on home value and weren't accounted for.
- Data such as view, condition, and grade are subjective.
- Going forward would like to include complete set of variables in analysis.

Thank You!
